

Accounting & User Management

A complete double-entry accounting system built for Bangladeshi retail, with enterprise-grade team and access controls included.

Who this is for

You run a retail business and want proper books — not a spreadsheet. You want to know your real profit, what customers owe you, what you owe suppliers, and you want to hand a clean trial balance to your auditor at year-end. You also want your staff to use the system without seeing everything or breaking anything.

This module gives you a full general ledger with automatic posting, the financial reports your accountant expects, and a role-based team system so the right people see the right things. It is designed around how shops in Bangladesh actually operate — BDT, NBR VAT returns, cash-and-mobile-wallet payments, and export to the accounting software your auditor already uses.

What you get — Accounting

The books, kept automatically

- **Chart of Accounts** — a ready-made account structure (Assets, Liabilities, Equity, Revenue, Expenses) you can extend with your own groups and accounts.
- **Automatic posting** — when you make a sale, record a purchase, pay an expense, transfer funds, or take a customer payment, the correct double-entry journal is created for you. No manual bookkeeping for everyday transactions.
- **Manual vouchers** — Cash & Bank Payment/Receive, Fund Transfer, and Journal vouchers when you need them, with automatic voucher numbering and a built-in check that debits always equal credits.
- **General Ledger** — every account's full history with running balances.
- **Opening balances** — migrating from another system or from paper? Import your starting balances and carry on.

Reports your accountant will ask for

Report	What it tells you
Profit & Loss	Are you making money — and where it's going
Comparative P&L	This period vs. last period vs. last year
Balance Sheet	What you own and owe, on any date
Trial Balance	The pre-audit summary every accountant starts from
Cash Flow Statement	Where cash actually came from and went
Cashbook & Bankbook	Cash and bank movement with running balances
Financial Ratios	Current ratio, margins, days-to-collect/pay, at a glance
Budget vs. Actual	How you're tracking against plan
Cost-Center P&L	Profit by branch or department

Money in, money out

- **Customer ledger & payments** — track credit sales, receipts, and balances per customer, with **AR Aging** (0–30 / 31–60 / 61–90 / 90+ days) so you know who's overdue.
- **Supplier ledger & payments** — the same for what you owe, with **AP Aging**.
- **Expenses** — categorised expense entries with their own reports, posted to the ledger automatically.
- **Loans** — track money you've borrowed and money you've lent, with repayment schedules.
- **Fixed assets & depreciation** — register assets and let the system generate monthly depreciation entries (straight-line or declining-balance).
- **Salary payments** and configurable **payment methods** (cash, card, mobile wallet, bank) linked to the right accounts.

Bangladesh-ready & audit-ready

- **VAT / Tax ledger** formatted for the NBR monthly VAT return.
- **Fiscal period locking** — close a month or year so no one can slip in a backdated entry. Unlocking is restricted to the business owner.
- **Bank reconciliation** — import your bank statement, auto-match by date and amount, reconcile the rest by hand.
- **Recurring journals** — set up rent, subscriptions, and other regular entries once; they post on schedule.
- **Cost centers / departments** — tag entries to a branch or department for segment-level reporting.
- **Full audit trail** on every voucher and account change — who, what, when.
- **Export to Tally and QuickBooks** — hand your auditor a file they can open directly.

What you get — User Management (included)

Every plan includes a complete team and access-control system, so the accounting module is safe to put in front of your whole staff.

Accounts & sign-in

- Email/password sign-up with your business and first store set up automatically.
- Email verification and self-service **password reset**.
- **Two-factor authentication (2FA)** for extra protection on owner accounts.
- Secure sessions — changing a password or logging out signs out everywhere.

Roles & permissions

- Four built-in roles — **Owner, Manager, Cashier, Accountant** — each with sensible default permissions. (An Accountant, for example, sees the ledger and financial reports but not your staff's payroll controls.)
- **47 fine-grained permissions** across products, inventory, sales, accounting, CRM, and administration.
- **Per-store, per-permission control** — grant someone access to one branch's sales but not its accounting, all from a simple grid.

Team & multi-branch

- **Invite staff by email**; they accept and join with the role you choose.
- Manage who can access which store, and who can switch between stores.
- Remove members safely (the system won't let you delete the last owner).

Oversight

- **Audit logs** of logins, password changes, team changes, and permission grants — filterable by person, action, and date.
- **API keys** for connecting other tools, issued and revoked by the owner.
- Multi-tenant isolation — your data is scoped to your business and stores at every layer.

How it fits together

Because posting is automatic, your team just does their job — a cashier rings up a sale, a manager records a purchase — and the books update themselves in the background. Your accountant works from clean, reconciled ledgers and exports to Tally or QuickBooks at period-end. You set permissions once, lock each month when it closes, and trust the audit trail for everything else.

Plans

The full accounting module is available on the **Premium Accounting Pack (€749/month)** — ideal if bookkeeping is your main need — and is also included in the **Standard** and **Premium** plans alongside the rest of the platform. **User management is included on every plan.**

Pricing shown is indicative; please confirm current rates and any onboarding or data-migration options with our team.

Next steps

- 1 **Demo** — we'll walk you through the ledger, reports, and team setup with sample data.
- 2 **Migration** — we import your chart of accounts and opening balances from your current system.
- 3 **Onboarding** — we set up your stores, roles, and staff, and configure VAT and fiscal periods for your business.

We'd be glad to schedule a live walkthrough whenever suits you.
